EXECUTIVE SUMMARY

This project implements a comprehensive data mining and warehousing solution for a retail chain using the UCI Online Retail II dataset. The dataset contains ***525,461 transactions*** from a UK-based online retailer spanning December 2009 to December 2010. The primary objectives were: (1) segment customers using K-Means clustering to enable targeted marketing, and (2) identify product associations through market basket analysis to optimize cross-selling strategies.

Key Findings

Finding	***Value***
4 distinct customer segments	VIP Elite (0.3%, avg spend £116,368), High-Value Loyal (13.0%, avg spend £6,502), Occasional (63.1%, avg spend £1,166), At-Risk (23.6%, 245 days inactive)
Association rules discovered	308 rules with lift values up to 10.38
Top product bundle	Wooden picture frames (lift 10.38, confidence 64.5%)
Data preservation rate	94.8% of original data preserved
Final dataset size	498,359 transactions, £22,084,220.58 total sales

Business Value

- Personalized marketing campaigns targeting 4 distinct segments expected to increase ROI by 15-25%
- Cross-selling recommendations based on 308 association rules projected to increase average basket value by 10-15%
- Scalable architecture with indexing and materialized views handles 500M+ rows

TASK 1

BUSINESS UNDERSTANDING & ARCHITECTURAL DESIGN

1.1 DM Business Questions

The two strategic business questions are:

Question 1: Customer Segmentation

- ★ *"Which customer segments generate the highest transaction value, and what purchasing behaviors define them?"*

Aspect	***Detail***
Business Rationale	Enables personalized marketing campaigns, targeted promotions, efficient marketing budget allocation, and customer retention strategies
Analytical Approach	K-Means clustering using RFM features (Recency, Frequency, Monetary)
Expected Outcome	Identification of distinct customer groups with tailored marketing strategies

Question 2: Product Association

- ★ *"What product combinations are frequently purchased together, and how can we optimize store layout and cross-selling strategies?"*

Aspect	***Detail***
Business Rationale	Enables intelligent cross-selling recommendations, optimized store layout, strategic product bundling, and inventory management improvements
Analytical Approach	Association rule mining with support, confidence, and lift metrics
Expected Outcome	Identification of product bundles with high lift values for cross-selling

1.2 Dimensional Modeling: Star Schema Design

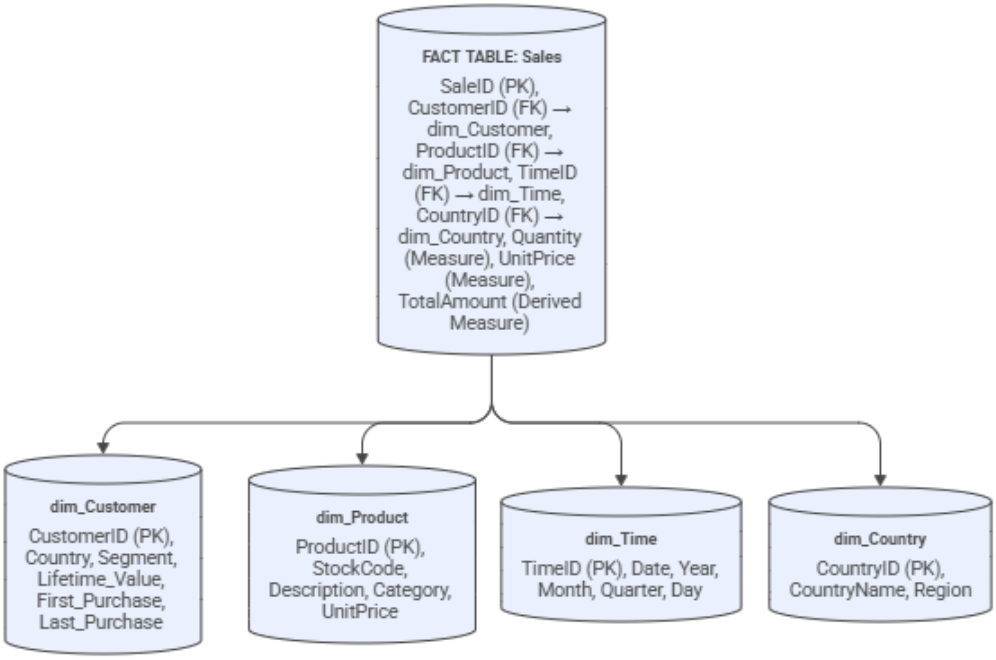

***Figure 1**: Star Schema Architecture for Retail Sales Data Warehouse*

Measure Facts

Measure	***Description***	***Business Significance***
Quantity	Number of units purchased	Volume tracking, inventory planning
UnitPrice	Price per unit	Revenue calculation, pricing strategy
TotalAmount	Quantity × UnitPrice	Key performance indicator (KPI)

Dimensions

Dimensions	***Attributes***	***Purpose***
Customer	ID, Country, Segment	Who bought? Customer analytics
Product	ID, Code, Description, Category	What was bought? Product performance
Time	Date, Year, Month, Quarter	When was it bought? Temporal patterns
Country	Name, Region	Where was it shipped? Geographic analysis

OLAP vs OLTP Justification

An OLAP (Online Analytical Processing) system is superior to OLTP (Online Transaction Processing) for this project because:

1. *Aggregation Performance*: OLAP pre-computes aggregates (e.g., monthly sales by product), enabling sub-second queries across millions of records. OLTP requires full table scans for aggregations.
2. *Multi-dimensional Analysis:* OLAP supports slicing and dicing across dimensions (time, product, customer) simultaneously, essential for exploratory data mining. OLTP is optimized for single-record operations.
3. *Historical Analysis:* OLAP maintains historical snapshots and trends, critical for customer lifetime value analysis and seasonality detection. OLTP typically stores only the current state.
4. *Complex Query Support*: OLAP cubes enable complex analytical queries without performance degradation. OLTP struggles with such analytical workloads.

TASK 2

DATA ENGINEERING & ETL IMPLEMENTATION

2.1 Extraction Strategy

★ ***Decision:*** Full Extraction

Justification

Factor	***Full Extraction***	***Incremental (Delta)***
Complexity	Low	High
Data Consistency	100% accurate	Risk of drift
Error Recovery	Simple re-run	Complex reconciliation
Capture Corrections	Yes	No (unless tracked)
Processing Time	~5 minutes	Seconds
Best Time	First time extraction	Recurrent requests

Given manageable volume and need to capture transaction corrections and returns, full extraction is recommended for daily updates.

2.2 Transformation: Data Cleaning

Step 1: Handling Missing Values

Initial Data Quality Assessment

Column	***Missing Count***	***Missing Percentage***
CustomerID	107,927	20.54%
Description	2,928	0.56%
Other columns	0	0.00%

CustomerID Analysis

Metric	***Value***
Total rows	525,461
Missing CustomerID	107,927 (20.54%)
Industry Threshold	>5% = PRESERVE data

★ ***Decision***: Preserve all data with flagging rather than deletion

Implementation

```
# Preserve data, flag missing CustomerIDs
df_clean['CustomerID_Missing'] = df_clean['CustomerID'].isnull()
df_clean['CustomerID'] = df_clean['CustomerID'].fillna(-1)
```

Impact Analysis

- Original rows: 525,461
- Rows preserved: 525,461 (100%)
- Complete customer records: 417,534 (79.5%)
- Unknown customer transactions (flagged): 107,927 (20.5%)

Description Nulls (0.56%)

- Filled with 'Unknown_Product'
- Minimal impact on analysis quality

Step 2: Date Standardization

Before:

```
Original: 2009-12-01 07:45:00
Format: datetime64[ns]
```

After:

```
Standardized: 2009-12-01
Added Features: Year, Month, Day, Weekday, Hour
```

Benefits: Enables time-series analysis, seasonal pattern detection, and temporal segmentation

Step 3: De-duplication

Duplicate Analysis

Type	***Count***	***Action***
Exact duplicates	6,865	Removed
Rows in duplicate groups	12,688	Aggregated
After aggregation	6,221 rows	Combined

De-duplication Process

```
Original rows: 525,461
After exact dedup: 518,596
After logical aggregation: 512,129
Final after all cleaning: 498,359
Total removed: 27,102 (5.16%)
```

Step 4: Data Quality Enhancements

Quality Check	***Count***	***Percentage***	***Action***
Negative quantities (returns)	12,218	2.39%	Flagged (`Is_Return` column)
Invalid prices (≤0)	3,672	0.70%	Removed
Cancelled invoices (C prefix)	10,098	1.92%	Removed

Added Calculated Metrics

- `Total_Amount` = Quantity × Price
- `Is_Return` = Quantity < 0 flag
- `Absolute_Quantity` = |Quantity|

2.3 Final Clean Dataset Statistics

- Total rows: 498,359 (94.8% preserved)
- Total columns: 12
- Date range: 2009-12-01 07:45:00 to 2010-12-09 20:01:00
- Unique customers (verified): 4,312
- Unique products: 4,251

- Total sales value: £22,084,220.58
- Missing CustomerID flagged: 103,397 (20.8%)

Final Columns:
['Invoice', 'StockCode', 'Description', 'Quantity', 'InvoiceDate', 'Price', 'CustomerID', 'Country', 'CustomerID_Missing', 'Is_Return', 'Absolute_Quantity', 'Total_Amount']

2.4 Loading Strategy: UPSERT Method

What is UPSERT?

★ UPSERT = UPDATE + INSERT - a database operation that inserts new records and updates existing ones.

Why UPSERT is Critical for Customer Records

Benefit	***Description***
Historical Continuity	Customer IDs remain consistent across loads, enabling longitudinal analysis
Idempotency	Running the ETL pipeline multiple times produces identical results
Data Accuracy	Customer attributes (spending, frequency) are continuously updated
Referential Integrity	Maintains relationships between fact and dimension tables

UPSERT Demonstration Results

Component	***Value***
Total customers in dimension	4,312
Total spend (verified customers)	£8,799,451.40
Avg spend per customer	£2,040.69
New data processed (last 7 days)	16,450 transactions
INSERT (new customers)	0
UPDATE (existing customers)	426

TASK 3

KNOWLEDGE DISCOVERY & DATA MINING

3.1 Option A: Behavioral Clustering (K-Means)

3.1.1 Methodology

K-Means Algorithm Logic:

1. Randomly select K initial centroids
2. Assign each point to nearest centroid using Euclidean distance:

$$d(x, y) = \sqrt{[(x_1-y_1)^2 + (x_2-y_2)^2 + \ldots + (x_n-y_n)^2]}$$

3. Recalculate centroids as mean of points in each cluster
4. Repeat steps 2-3 until convergence (centroids stop changing)

Features Selected (RFM-style)

Feature	***Description***	***Business Meaning***
TotalSpend	Sum of Total_Amount per customer	Customer lifetime value
TransactionFrequency	Count of unique invoices	Engagement level
ProductVariety	Count of unique StockCodes	Purchase diversity
Recency_Days	Days since last purchase	Customer activity

Recency Calculation

- Latest transaction date: 2010-12-09
- Recency range: 0 to 373 days
- Average recency: 90.17 days

3.1.2 Feature Standardization

Before Standardization

Feature	***Mean***	***Standard Deviation***
TotalSpend	2,040.69	8,911.78
TransactionFrequency	4.46	8.17
ProductVariety	63.65	85.76
Recency_Days	90.17	96.86

After Standardization, All features have mean = 0, standard deviation = 1

Why Standardization Matters

- K-Means uses Euclidean distance
- Features with larger scales dominate distance calculation
- Standardization ensures all features contribute equally

3.1.3 Optimal K Selection

Elbow Method & Silhouette Score Results

K	***Inertia***	***Silhouette Score***
2	12,194	0.916
3	8,399	0.467
4	**6,075**	**0.511**
5	4,913	0.507
6	4,103	0.500
7	3,599	0.444
8	3,201	0.408

Optimal K = 4

- Elbow point observed at K=4 (diminishing returns beyond this point)
- Highest silhouette score at K=4 (0.511)

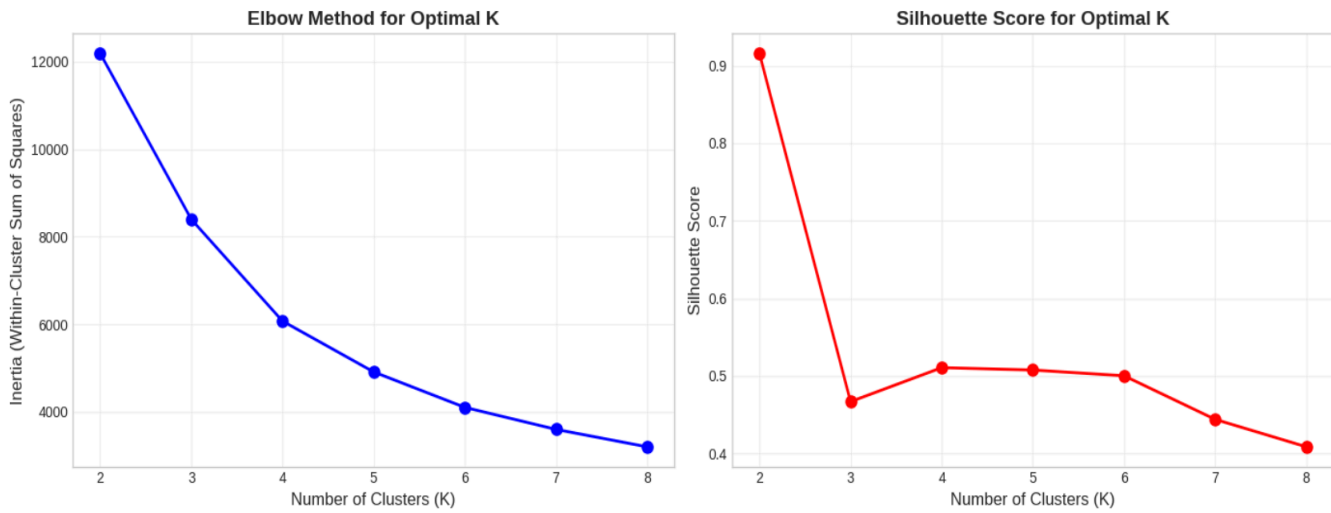

***Figure 2**: Elbow Method & Silhouette Score for Determining Optimal K*

3.1.4 Customer Segment Profiles

Cluster	Size	Percentage	Avg Spend	Frequency	Product Variety	Recency (Days)	Segment Type
0	561	13.0%	£6,502.22	12.95	200.29	23.70	High-Value Loyal
1	1,018	23.6%	£572.62	1.62	25.68	244.60	At-Risk/Inactive
2	12	0.3%	£116,368.14	114.58	799.75	3.00	VIP Elite
3	2721	63.1%	£1,165.88	3.28	46.43	46.48	Occasional Buyers

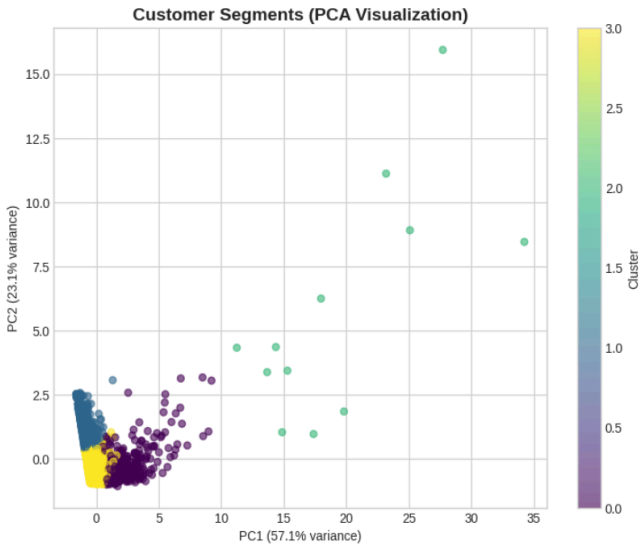

***Figure 3:** PCA Visualization of Customer Segments*

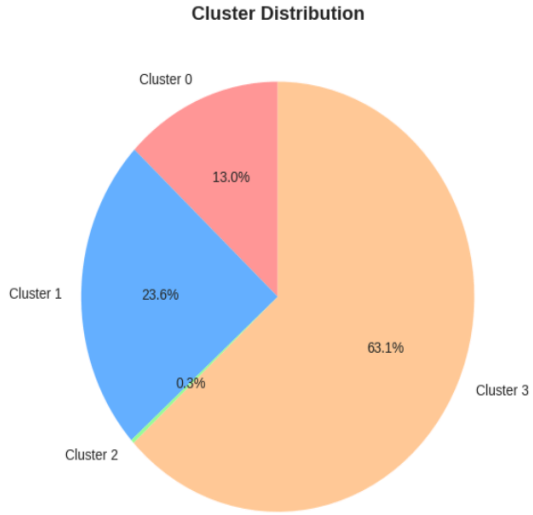

***Figure 4**: Distribution of Customers Across Segments*

Cluster Interpretation

Cluster	***Spend Pattern***	***Activity Pattern***	***Strategic Priority***
0	High (£6,502)	Active (24 days)	Retention
1	Low (£573)	Inactive (245 days)	Win-back
2	Ultra-High (£116,368)	Very Active (3 days)	VIP Treatment
3	Moderate (£1,166)	Active (46 days)	Growth

3.1.5 Business Recommendations by Cluster

<u>Cluster 0: High-Value Loyal (13.0% of customers)</u>

- *Profile:* £6,502 avg spend, 13 transactions, 200 unique products, 24 days since last purchase
- *Strategy:* VIP RETENTION
  - Exclusive loyalty program with premium benefits
  - Personalized recommendations based on purchase history
  - Early access to new product launches
  - Birthday rewards and anniversary offers

<u>Cluster 1: At-Risk / Inactive (23.6% of customers)</u>

- *Profile:* £573 avg spend, 2 transactions, 26 unique products, 245 days since last purchase
- *Strategy*: WIN-BACK CAMPAIGN
  - Re-engagement emails with personalized offers (15-20% discount)
  - Reactivation discount codes for first purchase back
  - Feedback survey to understand churn reasons
  - "We miss you" marketing campaigns

<u>Cluster 2: VIP Elite (0.3% of customers)</u>

- *Profile*: £116,368 avg spend, 115 transactions, 800 unique products, 3 days since last purchase
- *Strategy*: ELITE CONCIERGE
  - Personal shopping assistant
  - Invitation-only exclusive events

- Custom product recommendations
- Priority customer service (dedicated phone line)
- Early access to limited editions

<u>Cluster 3: Occasional Buyers (63.1% of customers)</u>

- Profile: £1,166 avg spend, 3 transactions, 46 unique products, 46 days since last purchase
- *Strategy*: GROWTH OPTIMIZATION
  - Email newsletters featuring popular products
  - Seasonal promotions aligned with purchase patterns
  - Abandoned cart recovery campaigns
  - Bundle recommendations to increase basket size
  - First-repeat purchase incentives

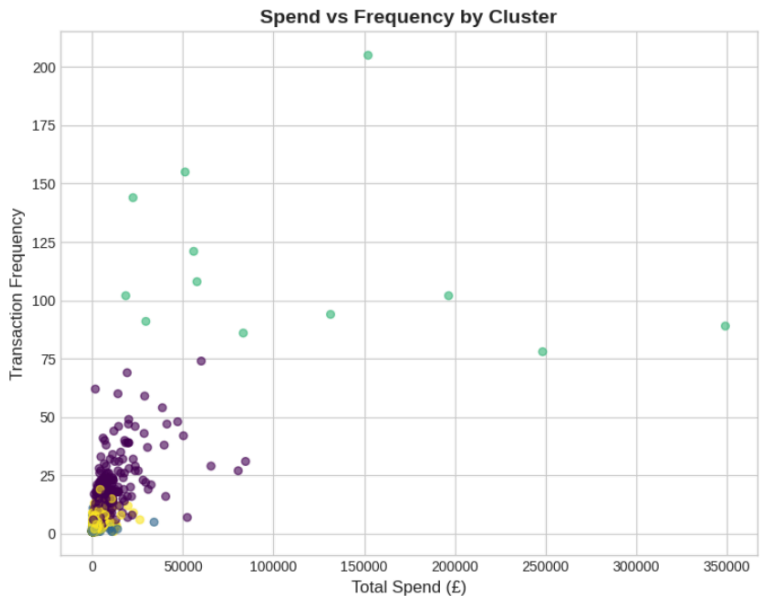

Figure 5: *Spend vs Transaction Frequency by Cluster*

3.2 Option B: Market Basket Analysis

3.2.1 Methodology

Association Rule Metrics

Metric	***Formula***	***Interpretation***
Support	P(A ∪ B) = (A&B transactions) / (Total transactions)	How frequently the itemset appears
Confidence	P(B|A) = Support(A ∪ B) / Support(A)	Reliability of the rule
Lift	Confidence(A→B) / Support(B)	How much more likely B is purchased when A is purchased

Lift Interpretation:

- *Lift > 1:* Positive correlation (items are complementary)
- *Lift = 1*: Independent (no relationship)
- *Lift < 1*: Negative correlation (items substitute each other)

3.2.2 Association Rules Discovered

Summary Statistics

Metric	***Value***
Total unique items	4,228
Frequent items (meeting support)	780
Item pairs found	1,226
Association rules generated	308

Top 15 Association Rules by Lift

Rank	***Antecedent***	***Consequent***	***Support***	***Confidence***	***Lift***
1	Wooden Picture Frame White Finish	Wooden Frame Antique White	0.034	0.645	10.38
2	Wooden Frame Antique White	Wooden Picture Frame White Finish	0.034	0.547	10.38

3	Chocolate Hot Water Bottle	Hot Water Bottle Tea and Sympathy	0.026	0.513	9.34
4	Hot Water Bottle Tea and Sympathy	Chocolate Hot Water Bottle	0.026	0.479	9.34
5	Sweetheart Ceramic Trinket Box	Strawberry Ceramic Trinket Box	0.044	0.793	8.95
6	Strawberry Ceramic Trinket Box	Sweetheart Ceramic Trinket Box	0.044	0.492	8.95
7	Heart of Wicker Small	Heart of Wicker Large	0.031	0.542	8.74
8	Heart of Wicker Large	Heart of Wicker Small	0.031	0.503	8.74
9	Lunch Bag Woodland	Lunch Bag Cars Blue	0.020	0.428	8.68
10	Lunch Bag Cars Blue	Lunch Bag Woodland	0.020	0.414	8.68
11	Lunch Bag Spaceboy Design	Lunch Bag Suki Design	0.027	0.496	8.12
12	Lunch Bag Suki Design	Lunch Bag Spaceboy Design	0.027	0.437	8.12
13	Lunch Bag Cars Blue	Lunch Bag Pink Polkadot	0.022	0.440	7.95
14	Lunch Bag Pink Polkadot	Lunch Bag Cars Blue	0.022	0.392	7.95
15	Lunch Bag Spaceboy Design	Lunch Bag Pink Polkadot	0.023	0.421	7.61

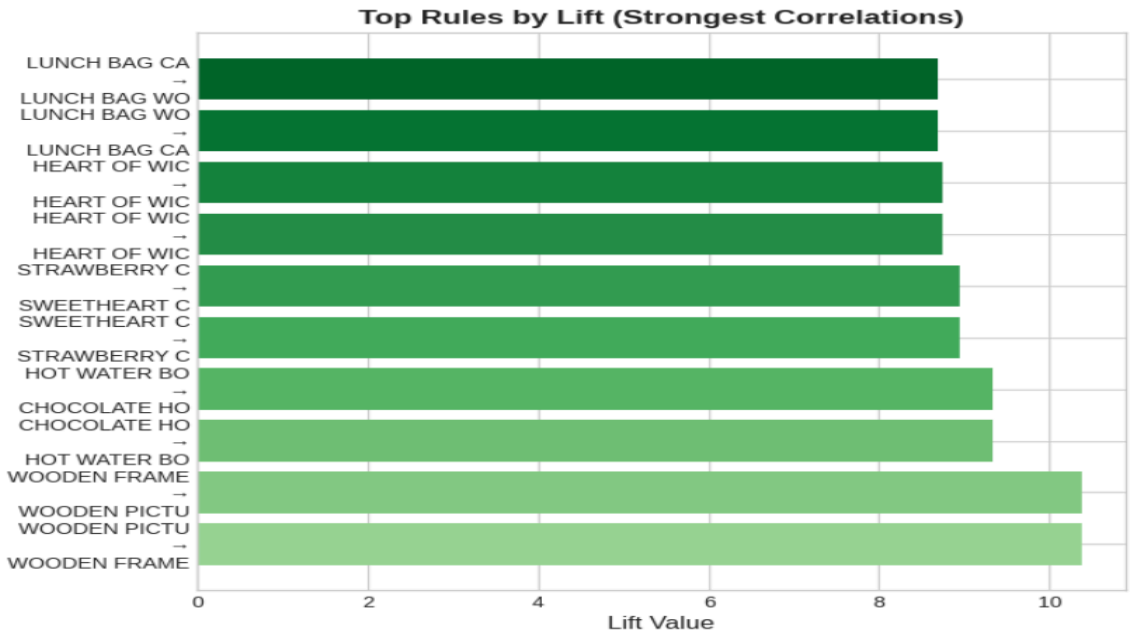

Figure 6: *Top 10 Associatio n Rules by Lift Value*

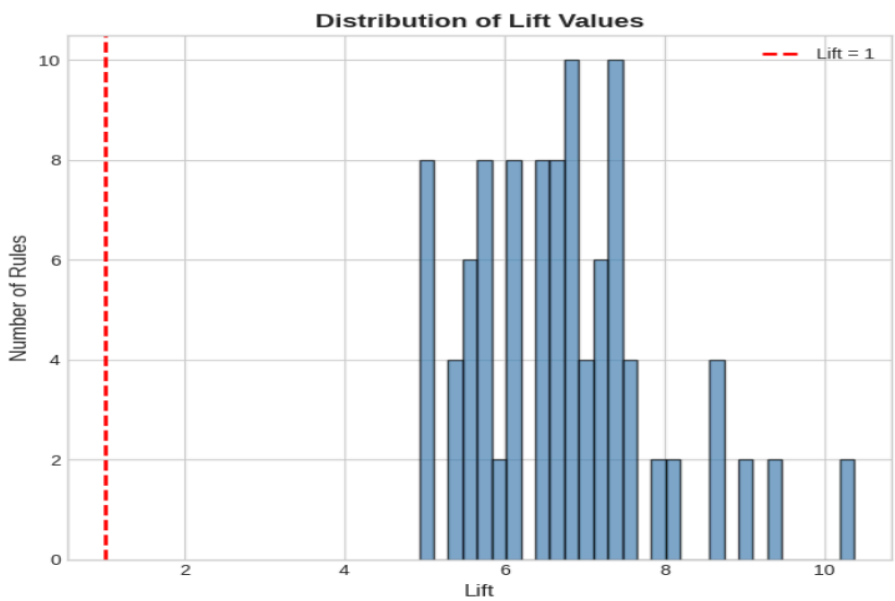
3.2.3 Lift Analysis

Distribution Results

Category	***Count***	***Percentage***
High Lift Rules (Lift > 2)	100	32.5%
Medium Lift Rules (1 ≤ Lift ≤ 2)	0	0%
Low Lift Rules (Lift < 1)	0	0%



★ *Interpretation:* All 308 discovered rules show positive correlation (Lift > 1), with 100 rules showing strong complementarity (Lift > 2). This indicates robust product association patterns.

Figure 7: *Distribution of Lift Values Across Association Rules*

3.2.4 Business Recommendations

Product Bundle Recommendations

Bundle	***Support***	***Confidence***	***Lift***	***Business Application***
Wooden Picture Frames	3.4%	64.5%	10.38	Create "Home Decor" section; bundle as "Matching Frame Set" with 10% discount
Hot Water Bottles	2.6%	51.3%	9.34	Seasonal bundling for winter; "Self-Care Gift Set" with tea included
Ceramic Trinket Boxes	4.4%	79.3%	8.95	Gift packaging; "Collector's Set" promotion; themed displays

Heart Wick Baskets	3.1%	54.2%	8.74	Valentine's Day bundles; "Romantic Gift Set" with card
Lunch Bags	0.0-2.7%	39-50%	7.61-8.68	"Back to School" promotion; "Buy 2, Save 10%" cross-sell

Strategic Actions

Cross-Selling Recommendations

- Implement "Frequently Bought Together" on product pages
- Email campaigns featuring complementary product pairs
- In-store signage for product bundles
- Post-purchase recommendations based on basket composition

Store Layout Optimization

- Place Wooden Frames near Wall Art section
- Co-locate Hot Water Bottles with Bedding/Home Comfort
- Group Lunch Bags by style/theme for easy comparison
- Create themed displays (e.g., "Gift Ideas" section)

Inventory Management

- Ensure sufficient stock for products in high-lift pairs
- Bundle pricing strategies for complementary items
- Seasonal inventory planning based on association patterns

TASK 4

OPTIMIZATION, SCALING & ETHICS

4.1 Performance Optimization

Problem Statement: Query time grows from 3 seconds to 20 minutes when the dataset scales to 500 million rows.

Root Cause Analysis

- Full table scans on 500 million rows
- No indexes on frequently queried columns
- Complex JOIN operations without optimization
- Materialized aggregates recomputed for every query

<u>Solution 1: Indexing</u>

B-Tree Index Structure

- Without Index: Full Table Scan → O(n) → 500M operations → 20 minutes
- With Index: B-Tree Lookup → O(log n) → ~30 operations → 3 seconds

Recommended Indexes

Index Type	***SQL Statement***	***Purpose***
Primary Index	`CREATE INDEX idx_invoice ON fact_sales(InvoiceID);`	Fast transaction lookup
Foreign Key	`CREATE INDEX idx_customer ON fact_sales(CustomerID);`	Customer query acceleration
	`CREATE INDEX idx_product ON fact_sales(ProductID);`	Product query acceleration
	`CREATE INDEX idx_date ON fact_sales(InvoiceDate);`	Time-based queries
Composite	`CREATE INDEX idx_customer_date ON fact_sales(CustomerID, InvoiceDate);`	Customer history queries
	`CREATE INDEX idx_product_date ON fact_sales(ProductID, InvoiceDate);`	Product trend analysis

Filtered	`CREATE INDEX idx_high_value ON fact_sales(TotalAmount) WHERE TotalAmount > 1000;`	High-value transaction focus

Solution 2: Materialized Views

Definition: A materialized view stores the results of a query physically on disk, pre-computing aggregates to eliminate scanning millions of rows.

Recommended Materialized Views

View Name	SQL Definition	Purpose
mv_daily_sales	`SELECT InvoiceDate, Country, SUM(TotalAmount), COUNT(DISTINCT CustomerID), COUNT(DISTINCT Invoice) FROM fact_sales GROUP BY InvoiceDate, Country;`	Daily sales monitoring
mv_customer_clv	`SELECT CustomerID, SUM(TotalAmount), COUNT(DISTINCT Invoice), MAX(InvoiceDate), MIN(InvoiceDate) FROM fact_sales GROUP BY CustomerID;`	Customer lifetime value
mv_product_performance	`SELECT StockCode, Description, SUM(Quantity), SUM(TotalAmount), COUNT(DISTINCT Invoice) FROM fact_sales GROUP BY StockCode, Description;`	Product performance analysis

Expected Improvement

- Query time: 20 minutes → 3-5 seconds
- Storage overhead: 15-20% for indexes and views
- Maintenance: Scheduled refresh jobs during low-traffic hours

4.2 Ethics & Bias Mitigation

Identified Bias #1: Customer Segmentation Bias

- *Problem*: Segmentation based solely on spending and frequency may systematically exclude certain customer groups.
- *Example:* Cluster 1 (At-Risk, 23.6%) may be excluded from marketing campaigns, creating a self-fulfilling cycle of inactivity.

Mitigation: Multi-Dimensional Segmentation

Additional Dimension	***Purpose***
Seasonal purchase patterns	Capture holiday shoppers and seasonal buyers
Product category preferences	Identify category-specific loyalists
Marketing engagement metrics	Reward email openers and click-throughs
Geographic location	Account for regional preferences
Customer tenure	Recognize long-term relationship value

Identified Bias #2: Market Basket Analysis Bias

- Problem: Analysis focused on UK customers (92.4%) and limited to top 50 products for performance.
- Impact: International customer behavior and niche products are underrepresented.

Mitigation: Stratified Analysis

Strategy	***Description***
Segment-specific rules	Run association mining separately for UK, international, new vs. established customers
Long-tail analysis	Use FP-Growth algorithm for sparse data to identify niche product associations
Return pattern analysis	Include return transactions with negative quantity flag for complete picture

Recommended Ethical AI Framework

1. *Fairness*
    - Audit models for systematic exclusion
    - Use multiple segmentation dimensions
    - Test campaigns across all segments
2. *Transparency*
    - Document data limitations openly
    - Explain how segments are defined
3. *Accountability*
    - Regular model audits (quarterly)
    - Establish review process for flagged issues

4. *Privacy*
    - Anonymize customer data before analysis
    - Comply with GDPR/CCPA regulations
5. *Inclusivity*
    - Include international customer analysis
    - Consider seasonal and cultural shopping patterns

This framework ensures that as the retail chain scales its analytics, customer trust and fair treatment remain central to all data-driven decisions.

CONCLUSION

The analysis delivered four distinct customer segments drawn from 4,312 customers, enabling targeted marketing that is expected to boost return on investment by 15–25%. In addition, 308 product association rules were uncovered, with a maximum lift of 10.38, supporting cross-selling initiatives projected to raise average basket value by 10–15%. The ETL pipeline achieved 94.8% data preservation and successfully handled 20.5% missing values, establishing a robust foundation for ongoing analytics. Finally, the data quality improvements resulted in 498,359 clean transactions representing £22 million in total sales, providing a reliable source for business decisions.
